a run of validator.py
Python 3.9 or later; the inputs parse; every gate id implemented (or d-*); one row per gate; the layout keys known; --allow-pending names only the closed list; the contracts apply?
no
yes
exit 2 — tool failure (never a pass, never a fail)
any high or blocking note? (with --determinism, reports that differ are a high note)
yes
no
exit 1 — a high or blocking note
any pending row whose gate --allow-pending does not name?
yes
no
exit 4 — not measured, which is not green
exit 0 — every gate measured or accepted by name, and no high or blocking note
