a regression escaped every gate
golden rule 4: a gate, or a recorded reason not to make one
no code can read it, or its rule moved into a contract
a gate can read it
no_gate: the reason written (at least 8 distinct words, or the name of a decided owner decision)
gate written, with its perturbation, its row in the gate table and its assignment in the artifact list
no: it measures the wrong thing
does the gate reject the version that motivated it?
yes; then the fix
live: measured on every run; its perturbation is caught in the sensitivity report
its object is gone, or its rule moved into a contract
a false positive is reported (an instrument defect until proven otherwise)
retired: the row, the assignment and the perturbation leave together; the CHANGELOG records the reason and the rounds the gate stayed silent
never a loosened limit
root-cause fix of the rule, a test that reproduces the case, the previous round redone
