v1: the whole target, quickly;
every artifact present, even if bad
validator at exit 0, sensitivity
report current, before any review
review dispatch: the files and the frozen
rubric only; record the output limit
and the reason the generation ended
verdict by the mechanical rule
rejected, with
conditions, or accepted
incomplete
import the notes into the ledger:
the router refuses an unknown target and
deduplicates; only high and blocking
return the artifact to its owner
tool failure: ended for length,
or a section missing → run again
classify each finding
escaped regression:
the gate and its perturbation
first, then the fix;
ledger line 'escaped'
false positive:
root-cause fix, a reproducing
test, the previous round redone
product defect:
a note to the artifact
where it was born
rebuild what is stale; gates; validator;
an entry in lessons.md; a round-record line
(kind, executors by family, reviewer_relation,
prev, family_map_commitment)
stopping criterion met?
no: the same rubric,
the item-by-item table
yes
open notes recorded in the contract,
no non-negotiable among them;
the method document; priors.json pinned
